Grade Calculator & Performance Tracker

The main goal of the Grade Calculator & Performance Tracker is to provide students with a simple, automated tool to determine their final course percentage and letter grade. By removing manual calculation errors, the program gives students an immediate, clear overview of their academic performance so they can make informed decisions about their study habits. The target audience includes middle school, high school, and college students, as well as educators or tutors who need a quick way to calculate grade averages and feedback without using complicated spreadsheet tools.

To accomplish this, the program prompts the user to enter their earned scores and maximum possible points across key coursework categories such as Homework, Quizzes, and Exams. It converts these raw inputs into a weighted or overall percentage, assigns a corresponding letter grade (A, B, C, or F), and outputs personalized academic feedback based on the final performance level.

Key strengths of the program include a simple and intuitive command-line user interface, instant feedback based on the standard grading rubrics, and built-in input validation to ensure scores cannot be negative numbers. However, current weaknesses include a lack of persistent storage meaning student data is not saved across sessions and the absence of a Graphical User Interface, as it operates entirely in text format.

Looking forward, future versions of the program will include saving student results to an external file (such as a text file) to track progress over an entire semester. Additionally, adding a GUI and allowing custom weight adjustments for different assignment categories would make the tool far more flexible for different courses.
